

# AI Vs ML Vs DL

## → Machine Learning

→ It provide state tool to learn, analyze, visualize & develop Predictive models from data & also forecasting model if time series data given.

A.I.

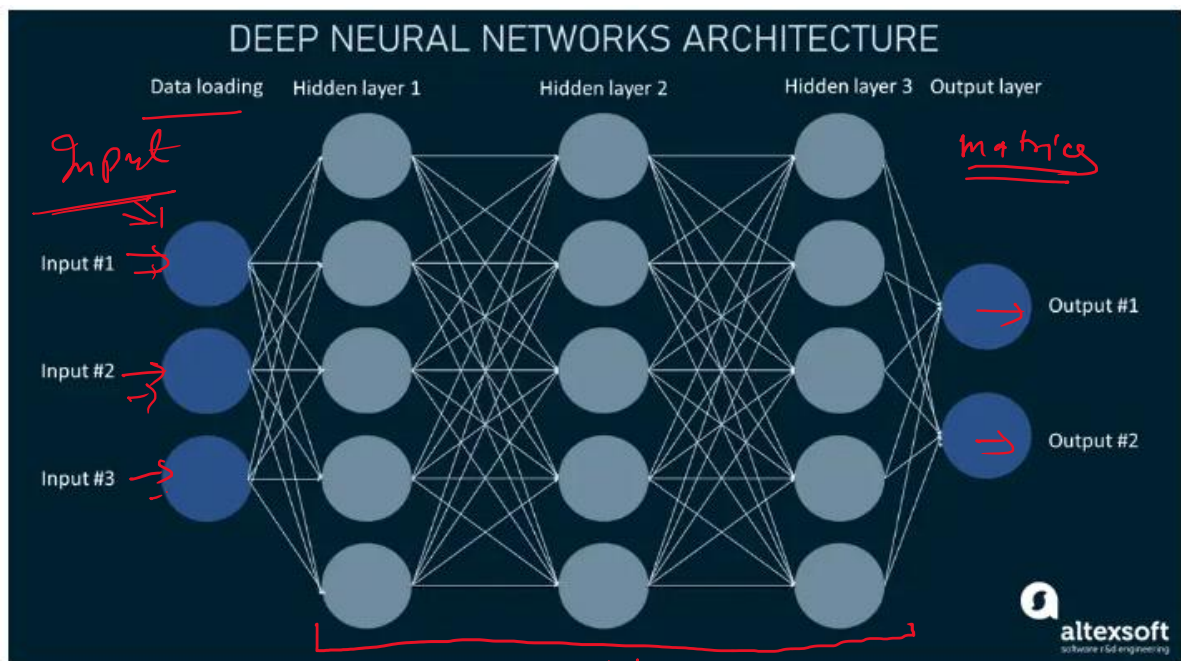

Smart application that can perform its own task without human intervention

eg \* Self driving car  
\* Robots

eg \* Recommendation system }  
\* Email spam filtering }

(a) Regression application }  
(b) Classification application }

DL (Deep learning) → mimic the human brain using multilayered Neural network

or  
 \* object detection →  
 + Image classification →  
 \* chessbots →

## What Is Machine Learning?

Machine Learning is the science (and art) of programming computers so they can learn from data.

Here is a slightly more general definition:

[Machine Learning is the] field of study that gives computers the ability to learn without being explicitly programmed.

—Arthur Samuel, 1959

And a more engineering-oriented one:

A computer program is said to learn from experience  $E$  with respect to some task  $T$  and some performance measure  $P$ , if its performance on  $T$ , as measured by  $P$ , improves with experience  $E$ .

—Tom Mitchell, 1997

Type of ML

① Supervised machine learning → classification  
 → Regression  
 ② Unsupervised machine learning

- ② Unsupervised machine learning
- ③ Semisupervised machine learning
- ④ Reinforcement learning

## ① Supervised ML

\* Dataset  $\rightarrow$  O/P

(a) Classification Independent features

No. of hr played

No. of hr Study

target  
↑  
Dependent feature  
↑  
O/P

Pass/Fail

8

2

Fail

6

4

Fail

7

3

Fail

5

5

Pass

4

6

Pass

O/P  $\rightarrow$  Pass/Fail

Regression

input variable  
out  $\leftarrow$

Dependent feature

10 1 1

## Regression

Input variable  
Independent feature

Output feature

o/p → target

1200 sqft	2	<u>12 L</u>
2000 sqft	3	<u>15 L</u>
3000 sqft	4	<u>20 L</u>
3500 sqft	5	<u>25 L</u>

- Ex →
- k-Nearest Neighbors
  - Linear Regression
  - Logistic Regression
  - Support vector machine (SVM)
  - Decision trees & Random forest

## ② = Unsupervised ML

- \* The training data is unlabeled
- Customer segmentation

MO  $\rightarrow$  O/P

① clusters  $\rightarrow$  group of similar data

Q

{ k-means  
DBSCAN  
Hierarchical cluster Analysis (HCA) }

② Anomaly detection  $\rightarrow$

\* One-class SVM  
\* Isolation forest }  $\rightarrow$

— semi-supervised ML

### ③ Semisupervised ML

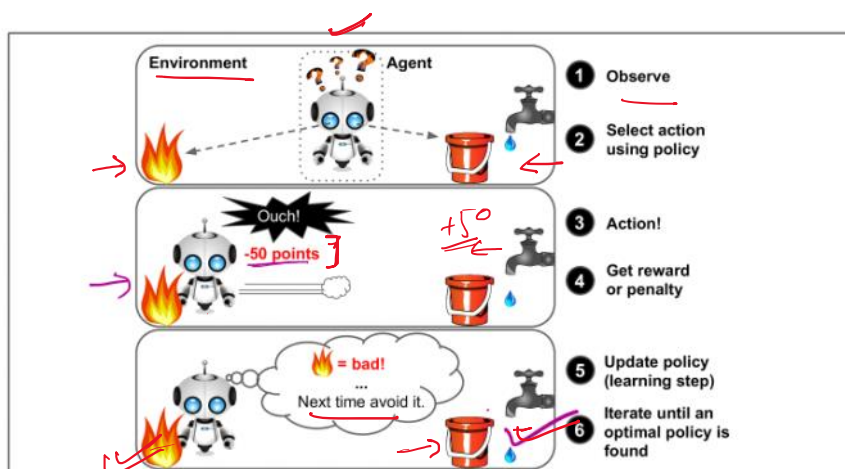

→ It is combination of supervised & unsupervised ML.  
eg Google Photos.

### ④ Reinforcement learning →

#### Reinforcement Learning

Reinforcement Learning is a very different beast. The learning system, called an agent in this context, can observe the environment, select and perform actions, and get rewards in return (or penalties in the form of negative rewards, as in [Figure 1-12](#)). It must then learn by itself what is the best strategy, called a policy, to get the most reward over time. A policy defines what action the agent should choose when it is in a given situation.
