### **Tuple**

07 July 2024 02:06 PM

# **Tuple**

Tuples are used to store multiple items in a single variable.

Tuple is one of 4 built-in data types in Python used to store collections of data, the other 3 are <u>List</u>, <u>Set</u>, and <u>Dictionary</u>, all with different qualities and usage.

A tuple is a collection which is ordered and unchangeable.

Tuples are written with round brackets.

### Example

```
Create a Tuple:
```

```
thistuple = ("apple", "banana", "cherry")
print(thistuple)
```

## **Tuple Items**

Tuple items are ordered, unchangeable, and allow duplicate values.

Tuple items are indexed, the first item has index [0], the second item has index [1] etc.

### Ordered

When we say that tuples are ordered, it means that the items have a defined order, and that order will not change.

## Unchangeable

Tuples are unchangeable, meaning that we cannot change, add or remove items after the tuple has been created.

## **Allow Duplicates**

Since tuples are indexed, they can have items with the same value:

### Example

```
Tuples allow duplicate values:
```

```
thistuple = ("apple", "banana", "cherry", "apple", "cherry")
print(thistuple)
```

## Tuple Length

To determine how many items a tuple has, use the len() function:

### Example

```
Print the number of items in the tuple:
```

```
thistuple = ("apple", "banana", "cherry")
print(len(thistuple))
```

## Create Tuple With One Item

To create a tuple with only one item, you have to add a comma after the item, otherwise Python will not recognize it as a tuple.

#### Example

thistuple = ("apple")
print(type(thistuple))

```
thistuple = ("apple",)
print(type(thistuple))
#NOT a tuple
```

One item tuple, remember the comma:

## Tuple Items - Data Types

Tuple items can be of any data type:

### Example

```
String, int and boolean data types:
```

```
tuple1 = ("apple", "banana", "cherry")
tuple2 = (1, 5, 7, 9, 3)
tuple3 = (True, False, False)
```

A tuple can contain different data types:

### Example

A tuple with strings, integers and boolean values:

```
tuple1 = ("abc", 34, True, 40, "male")
```

## type()

From Python's perspective, tuples are defined as objects with the data type 'tuple': <class 'tuple'>

#### Example

```
What is the data type of a tuple?
```

```
mytuple = ("apple", "banana", "cherry")
print(type(mytuple))
```

## The tuple() Constructor

It is also possible to use the tuple() constructor to make a tuple.

### Example

```
Using the tuple() method to make a tuple:
```

```
thistuple = tuple(("apple", "banana", "cherry")) # note the double round-brackets
print(thistuple)
```

# **Access Tuple Items**

You can access tuple items by referring to the index number, inside square brackets:

### Example

```
Print the second item in the tuple:
```

```
thistuple = ("apple", "banana", "cherry")
print(thistuple[1])
```

Note: The first item has index 0.

# **Negative Indexing**

Negative indexing means start from the end.
-1 refers to the last item, -2 refers to the second last item etc.

### Example

Print the last item of the tuple:

```
thistuple = ("apple", "banana", "cherry")
print(thistuple[-1])
```

## Range of Indexes

You can specify a range of indexes by specifying where to start and where to end the range. When specifying a range, the return value will be a new tuple with the specified items.

### Example

Return the third, fourth, and fifth item:

```
thistuple = ("apple", "banana", "cherry", "orange", "kiwi", "melon", "mango")
print(thistuple[2:5])
```

**Note:** The search will start at index 2 (included) and end at index 5 (not included). Remember that the first item has index 0.

By leaving out the start value, the range will start at the first item:

### Example

This example returns the items from the beginning to, but NOT included, "kiwi":

```
thistuple = ("apple", "banana", "cherry", "orange", "kiwi", "melon", "mango")
print(thistuple[:4])
```

By leaving out the end value, the range will go on to the end of the tuple:

### Example

This example returns the items from "cherry" and to the end:

```
thistuple = ("apple", "banana", "cherry", "orange", "kiwi", "melon", "mango")
print(thistuple[2:])
```

# Range of Negative Indexes

Specify negative indexes if you want to start the search from the end of the tuple:

#### Example

```
This example returns the items from index -4 (included) to index -1 (excluded)
```

```
thistuple = ("apple", "banana", "cherry", "orange", "kiwi", "melon", "mango")
print(thistuple[-4:-1])
```

### Check if Item Exists

To determine if a specified item is present in a tuple use the in keyword:

#### Example

```
Check if "apple" is present in the tuple:
thistuple = ("apple", "banana", "cherry")
if "apple" in thistuple:
print("Yes, 'apple' is in the fruits tuple")
```

Tuples are unchangeable, meaning that you cannot change, add, or remove items once the tuple is created. But there are some workarounds.

# **Change Tuple Values**

Once a tuple is created, you cannot change its values. Tuples are **unchangeable**, or **immutable** as it also is called. But there is a workaround. You can convert the tuple into a list, change the list, and convert the list back into a tuple.

### Example

Convert the tuple into a list to be able to change it:

```
x = ("apple", "banana", "cherry")
y = list(x)
y[1] = "kiwi"
x = tuple(y)
print(x)
```

## Add Items

Since tuples are immutable, they do not have a built-in append() method, but there are other ways to add items to a tuple.

1. Convert into a list: Just like the workaround for changing a tuple, you can convert it into a list, add your item(s), and convert it back into a tuple.

#### Example

Convert the tuple into a list, add "orange", and convert it back into a tuple:

```
thistuple = ("apple", "banana", "cherry")
y = list(thistuple)
y.append("orange")
thistuple = tuple(y)
```

2. **Add tuple to a tuple**. You are allowed to add tuples to tuples, so if you want to add one item, (or many), create a new tuple with the item(s), and add it to the existing tuple:

#### Example

Create a new tuple with the value "orange", and add that tuple:

```
thistuple = ("apple", "banana", "cherry")
y = ("orange",)
thistuple += y
```

### Remove Items

**Note:** You cannot remove items in a tuple.

Tuples are **unchangeable**, so you cannot remove items from it, but you can use the same workaround as we used for changing and adding tuple items:

### Example

Convert the tuple into a list, remove "apple", and convert it back into a tuple:

```
thistuple = ("apple", "banana", "cherry")
y = list(thistuple)
y.remove("apple")
thistuple = tuple(y)
```

Or you can delete the tuple completely:

### Example

The del keyword can delete the tuple completely:

```
thistuple = ("apple", "banana", "cherry")

del thistuple
```

print(thistuple) #this will raise an error because the tuple no longer exists

# **Tuple Methods**

Python has two built-in methods that you can use on tuples.

Method	Description
count()	Returns the number of times a specified value occurs in a tuple
index()	Searches the tuple for a specified value and returns the position of where it was found
